

The l3str-format package: formatting strings of characters

The L^AT_EX3 Project*

Released 2020-07-17

1 Format specifications

In this module, we introduce the notion of a string $\langle\text{format}\rangle$. The syntax follows that of Python's `format` built-in function. A $\langle\text{format specification}\rangle$ is a string of the form

$\langle\text{format specification}\rangle = [[\langle\text{fill}\rangle]\langle\text{alignment}\rangle][\langle\text{sign}\rangle][\langle\text{width}\rangle][.\langle\text{precision}\rangle][\langle\text{style}\rangle]$

where each [...] denotes an independent optional part.

- $\langle\text{fill}\rangle$ can be any character: it is assumed to be present whenever the second character of the $\langle\text{format specification}\rangle$ is a valid $\langle\text{alignment}\rangle$ character.
- $\langle\text{alignment}\rangle$ can be < (left alignment), > (right alignment), ^ (centering), or = (for numeric types only).
- $\langle\text{sign}\rangle$ is allowed for numeric types; it can be + (show a sign for positive and negative numbers), - (only put a sign for negative numbers), or a space (show a space or a -).
- $\langle\text{width}\rangle$ is the minimum number of characters of the result: if the result is naturally shorter than this $\langle\text{width}\rangle$, then it is padded with copies of the character $\langle\text{fill}\rangle$, with a position depending on the choice of $\langle\text{alignment}\rangle$. If the result is naturally longer, it is not truncated.
- $\langle\text{precision}\rangle$, whose presence is indicated by a period, can have different meanings depending on the type.
- $\langle\text{style}\rangle$ is one character, which controls how the given data should be formatted. The list of allowed $\langle\text{styles}\rangle$ depends on the type.

The choice of $\langle\text{alignment}\rangle =$ is only valid for numeric types: in this case the padding is inserted between the sign and the rest of the number.

2 Formatting various data-types

`\tl_format:Nn *` `\tl_format:nn {⟨token list⟩} {⟨format specification⟩}`

`\tl_format:cn *` `\tl_format:nn *`

Converts the *⟨token list⟩* to a string according to the *⟨format specification⟩*. The *⟨style⟩*, if present, must be `s`. If *⟨precision⟩* is given, all characters of the string representation of the *⟨token list⟩* beyond the first *⟨precision⟩* characters are discarded.

`\seq_format:Nn *` `\seq_format:nn {⟨sequence⟩} {⟨format specification⟩}`

`\seq_format:cn *`

Converts each item in the *⟨sequence⟩* to a string according to the *⟨format specification⟩*, and concatenates the results.

`\int_format:nn *` `\int_format:nn {⟨integer expr⟩} {⟨format specification⟩}`

Evaluates the *⟨integer expression⟩* and converts the result to a string according to the *⟨format specification⟩*. The *⟨precision⟩* argument is not allowed. The *⟨style⟩* can be `b` for binary output, `d` for decimal output (this is the default), `o` for octal output, `X` for hexadecimal output (using capital letters).

`\fp_format:nn *` `\fp_format:nn {⟨fpexpr⟩} {⟨format specification⟩}`

Evaluates the *⟨floating point expression⟩* and converts the result to a string according to the *⟨format specification⟩*. The *⟨style⟩* can be

- `e` for scientific notation, with one digit before and *⟨precision⟩* digits after the decimal separator, and an integer exponent, following `e`;
- `f` for a fixed point notation, with *⟨precision⟩* digits after the decimal separator and no exponent;
- `g` for a general format, which uses style `f` for numbers in the range $[10^{-4}, 10^{⟨precision⟩})$ and style `e` otherwise.

When there is no *⟨style⟩* specifier nor *⟨precision⟩* the number is displayed without rounding. Otherwise the *⟨precision⟩* defaults to 6.

3 Possibilities, and things to do

- Provide a token list formatting *⟨style⟩* which keeps the last *⟨precision⟩* characters rather than the first *⟨precision⟩*.

Index

The italic numbers denote the pages where the corresponding entry is described, numbers underlined point to the definition, all others indicate the places where it is used.
