24 A secret hook	129

File I

unicode-math.dtx

1 *Package metadata*

List all dtx files for (a) the `ins` file and (b) typesetting the code.

```
1 (*dtx)
2 \def\DTXFILES{
3   \DTX{unicode-math.dtx}
4   \DTX{um-code-opening.dtx}
5   \DTX{um-code-variables.dtx}
6   \DTX{um-code-api.dtx}
7   \DTX{um-code-ui.dtx}
8   \DTX{um-code-pkgopt.dtx}
9   \DTX{um-code-msg.dtx}
10  \DTX{um-code-usv.dtx}
11  \DTX{um-code-setchar.dtx}
12  \DTX{um-code-mathtext.dtx}
13  \DTX{um-code-main.dtx}
14  \DTX{um-code-fontopt.dtx}
15  \DTX{um-code-fontparam.dtx}
16  \DTX{um-code-mathmap.dtx}
17  \DTX{um-code-sym-commands.dtx}
18  \DTX{um-code-alphabets.dtx}
19  \DTX{um-code-primes.dtx}
20  \DTX{um-code-sscript.dtx}
21  \DTX{um-code-compat.dtx}
22  \DTX{um-code-amsmath.dtx}
23  \DTX{um-code-epilogue.dtx}
24 }
25 (/dtx)
```

Now exit if we're using plain TeX when loading this file with `unicode-math.ins`.

```
26 (*dtx)
27 \ifx\plainoutput\undefined\else\expandafter\endinput\fi
28 (/dtx)
```

Metadata for documentation; the title and authors of the package.

```
29 (*dtx)
30 \title{
31   Experimental Unicode mathematical typesetting:
32   The \pkg{unicode-math} package
33 }
34 \author{
35   \scshape Will Robertson\ \
36   \itshape Philipp Stephani, Joseph Wright, Khaled Hosny, and others\ \
37   \url{http://github.com/wspr/unicode-math}
```

```

38 }
39 
```

Declare the package version and date.

```

40 <base>\RequirePackage{expl3}
41 <base>\ProvidesExplPackage{unicode-math}
42 <package&XE>\ProvidesExplPackage{unicode-math-xetex}
43 <package&LU>\ProvidesExplPackage{unicode-math-luatex}
44 <base|package> {2020/01/31} {0.8q} {Unicode maths in XeLaTeX and LuaLaTeX}

```

Here the version and date are setup for typesetting the documentation.

```

45 <*>dtx>
46 \date{
47   \def\filedate{2020/01/31}
48   \def\fileversion{0.8q}
49   \filedate \quad \fileversion
50 }
51 
```

2 *The `unicode-math.sty` loading file*

The `unicode-math.sty` file is a stub which loads necessary packages and then splits into a XeTeX- or LaTeX-specific version of the package.

```

52 <base>\sys_if_engine_luatex:T
53 <base> {
54 <base>   \RequirePackageWithOptions{unicode-math-luatex}
55 <base>   \endinput
56 <base> }
57 <base>\sys_if_engine_xetex:T
58 <base> {
59 <base>   \RequirePackageWithOptions{unicode-math-xetex}
60 <base>   \endinput
61 <base> }
62 <base>\msg_new:nnn {unicode-math} {unsupported-engine}
63 <base> { Cannot~be~run~with~\c_sys_engine_str!\\ Use~XeLaTeX~or~Lu-
       aTeX instead. }
64 <base>\msg_error:nn {unicode-math} {unsupported-engine}
65 <base>\endinput

```

File II

um-code-opening.dtx

3 Start of the package code

The prefix for unicode-math is um:

```
1 (@@=um)
2 (*package)

Packages Assuming people are running up-to-date packages.

3 \RequirePackage{xparse,13keys2e}
4 \RequirePackage{fontspec}
5 \RequirePackage{fix-cm}
6 \RequirePackage{amsmath}
7 (LU)\RequirePackage{lualatex-math}

8 \cs_set_protected:Npn \@@_after_package:nNn #1 #2 #3
9 {
10   \AtBeginDocument
11   {
12     \cs_new_protected:Npn #2 {#3}
13     \ifpackageloaded {#1} {#2} {}
14   }
15 }
16 \RequirePackage{xparse,13keys2e}
17 \RequirePackage{fontspec}
18 \RequirePackage{fix-cm}
19 (LU)\RequirePackage{lualatex-math}
```

3.1 expl3 variants

Variants needed from expl3:

```
20 \cs_set_protected_nopar:Npn \exp_last_unbraced:NNx { ::N ::x_unbraced :::: }

For fontspec:

21 \cs_generate_variant:Nn \fontspec_set_family:Nnn {Nx,Nxx}
22 \cs_generate_variant:Nn \prop_get:NnNTF {cx}
23 \cs_generate_variant:Nn \tl_if_eq:nnF {o}
```

3.2 Low level commands

```
24 \cs_set_eq:NN \@@_group_begin: \group_begin:
25 \cs_set_protected:Npn \@@_group_end:n #1 { #1 \group_end: }
26 \cs_set_eq:NN \@@_group_begin_frozen: \@@_group_begin:
27 \cs_set_eq:NN \@@_group_end_frozen:n \@@_group_end:n
```

3.3 Primitive font commands

What might end up being provided by the kernel.

```
\@@_glyph_if_exist:NnTF
 28 \prg_new_conditional:Nnn \@@_glyph_if_exist:Nn {p,T,F}
 29 {
30   \tex_iffontchar:D #1 #2 \scan_stop:
31   \prg_return_true:
32 \else:
33   \prg_return_false:
34 \fi:
35 }
```

```
\@@_fontface_gset_eq:NN
 36 \cs_set_protected:Nn \@@_fontface_gset_eq:NN
 37 {
38   \tex_global:D \tex_let:D #1 #2
39 }
40 \cs_generate_variant:Nn \@@_fontface_gset_eq:NN {cN}
```

3.3.1 Mathcode and friends

\@@_set_mathcode:nnnn These are all wrappers for the primitive commands that take numerical input only.
\@@_set_mathcode:nnn

```
41 \cs_set:Npn \@@_set_mathcode:nnnn #1#2#3#4
42 {
43   \Umathcode \int_eval:n {#1} =
44   \mathchar@type#2 \csname sym#3\endcsname \int_eval:n {#4} \scan_stop:
45 }
46 \cs_set:Npn \@@_set_mathcode:nnn #1#2#3
47 {
48   \Umathcode \int_eval:n {#1} =
49   \mathchar@type#2 \csname sym#3\endcsname \int_eval:n {#1} \scan_stop:
50 }
```

\@@_set_mathchar>NNnn

\@@_set_mathchar:cNnn

```
51 \cs_set:Npn \@@_set_mathchar>NNnn #1#2#3#4
52 {
53   \Umathchardef #1 =
54   \mathchar@type#2 \csname sym#3\endcsname \int_eval:n {#4} \scan_stop:
55 }
56 \cs_generate_variant:Nn \@@_set_mathchar>NNnn {c}
```

\@@_set_delcode:nnn

```
57 \cs_new:Nn \@@_set_delcode:nnn
58 {
59   \Udelcode#2 = \csname sym#1\endcsname #3 \scan_stop:
60 }
```

```

\@@_radical:nn
 61 \cs_new:Nn \@@_radical:nn
 62 {
 63   \Uradical \csname sym#1\endcsname #2 \scan_stop:
 64 }

\@@_delimiter:Nnn
 65 \cs_new:Nn \@@_delimiter:Nnn
 66 {
 67   \Udelimiter \mathchar@type#1 \csname sym#2\endcsname #3 \scan_stop:
 68 }

\@@_accent:nnn
 69 \cs_new:Nn \@@_accent:nnn
 70 {
 71   \Umathaccent #1~ \mathchar@type\mathaccent \use:c { sym #2 } #3 \scan_stop:
 72 }

\@@_char_gmake_mathactive:N
\@@_char_gmake_mathactive:n
 73 \cs_new:Nn \@@_char_gmake_mathactive:N
 74 {
 75   \tex_global:D \tex_mathcode:D `#1 = "8000 \scan_stop:
 76 }

 77 \cs_new:Nn \@@_char_gmake_mathactive:n
 78 {
 79   \tex_global:D \tex_mathcode:D \int_eval:n {#1} = "8000 \scan_stop:
 80 }

```

\@@_mathactive_remap:nn Makes #1 math-active and defines its meaning to be #2. This is a global operation.

```

 81 \cs_new:Nn \@@_mathactive_remap:nn
 82 {
 83   \group_begin:
 84   \cs_set_protected:Npn \@@_tmp: {#2}
 85   \@@_char_gmake_mathactive:n {#1}
 86   \char_gset_active_eq:nN {#1} \@@_tmp:
 87   \group_end:
 88 }

```

3.3.2 NFSS-related interfaces

\@@_mathgroup_set:n Remember that \mathgroup is just \fam!

```

 89 \cs_new_protected:Nn \@@_mathgroup_set:n
 90 {
 91   \tex_fam:D #1 \scan_stop:
 92 }

```

3.3.3 Font parameters

```
\@@_copy_fontdimen:nnN
 93 \cs_new:Nn \@@_copy_fontdimen:nnN
 94 {
 95     \fontdimen #1 \font = \the \fontdimen #2 #3 \relax
 96 }

\@@_zero_fontdimen:n
 97 \cs_new:Nn \@@_zero_fontdimen:n
 98 {
 99     \fontdimen #1 \font = 0pt\relax
100 }

\@@_fontdimen_from_param:Nnn This function extracts the math font dimen #3 from the font #1 and sets fontdimen #2 of the same font to that value.
101 Use XETEX's fontdimen approach because it's tidy. We don't need bells and whistles here.
102 (*LU)
103 \cs_new_protected:Nn \@@_fontdimen_from_param:nn
104 {
105     \fontdimen #1 \font =
106         \lua_now:n { fonts.spec.mathfontdimen(font.current(),"#2") }
107     \scan_stop:
108 } (/LU)

\@@_int_if_zero_p:n
\@@_int_if_zero:nTF 109 \prg_new_conditional:Nnn \@@_int_if_zero:n {p,TF,T,F}
110 {
111     \int_compare:nNnTF {#1} = 0 { \prg_return_true: } { \prg_return_false: }
112 }
```

3.4 Alphabet Unicode positions (USVs)

Before we begin, let's define the positions of the various Unicode alphabets so that our code is a little more readable.¹

\usv_set:nnn, \@@_to_usv:nn Rather than 'readable', in the end, this makes the code more extensible.

```
113 \cs_new:Nn \usv_set:nnn { \tl_const:cN { c_@@_#1_#2_usv } {#3} }
114 \cs_new:Nn \@@_to_usv:nn { \use:c { c_@@_#1_#2_usv } }
```

\@@_usv_if_exist:nnTF

```
115 \prg_new_conditional:Nnn \@@_usv_if_exist:nn {T,F,TF}
116 {
117     \cs_if_exist:cTF { c_@@_#1_#2_usv }
118         \prg_return_true: \prg_return_false:
119 }
```

¹'U.s.v.' stands for 'Unicode scalar value'.

3.5 Overcoming `\@onlypreamble`

The requirement of only setting up the maths fonts in the preamble is lifted. (Perhaps unwisely.)

```
120 \tl_map_inline:nn
121   {
122     \new@mathgroup\cdp@list\cdp@elt\DeclareMathSizes
123     \@DeclareMathSizes\newmathalphabet\newmathalphabet@\@newmathalphabet@@
124     \DeclareMathVersion\define@mathalphabet\define@mathgroup\addtoversion
125     \version@list\version@elt\alpha@list\alpha@elt
126     \restore@mathversion\init@restore@version\dorestore@version\process@table
127     \new@mathversion\DeclareSymbolFont\group@list\group@elt
128     \new@symbolfont\SetSymbolFont\SetSymbolFont@\get@cdp
129     \DeclareMathAlphabet\new@mathalphabet\SetMathAlphabet\SetMathAlphabet@
130     \DeclareMathAccent\set@mathaccent\DeclareMathSymbol\set@mathchar
131     \set@mathsymbol\DeclareMathDelimiter@xx\DeclareMathDelimiter
132     \@DeclareMathDelimiter@x\DeclareMathDelimiter\set@mathdelimiter
133     \set@mathdelimiter\DeclareMathRadical\mathchar@type
134     \DeclareSymbolFontAlphabet\DeclareSymbolFontAlphabet@
135   }
136   {
137     \tl_remove_once:Nn \@preamblecmds {\do#1}
138   }
```

3.6 Wrappers for kernel commands

Messages themselves are defined in section §8.

```
139 \cs_new:Npn \@@_error:n    { \msg_error:nn      {unicode-math} }
140 \cs_new:Npn \@@_error:nx   { \msg_error:nnx     {unicode-math} }
141 \cs_new:Npn \@@_warning:n  { \msg_warning:nn    {unicode-math} }

File III

um-code-variables.dtx

4 Variable initialisation

1 (*package)

4.1 bool

True if using a proper OpenType font with unicode maths

2 \bool_new:N \g_@@_ot_math_bool

Set when \setmathfont is run to trap the problem of no main font defined.

3 \bool_new:N \g_@@_main_font_defined_bool

4 \bool_new:N \g_@@_init_bool

5 \bool_new:N \l_@@_implicit_alph_bool

For math-style:

6 \bool_new:N \g_@@_literal_bool

7 \bool_new:N \g_@@_upLatin_bool

8 \bool_new:N \g_@@_uplatin_bool

9 \bool_new:N \g_@@_upGreek_bool

10 \bool_new:N \g_@@_upgreek_bool

For bold-style:

11 \bool_new:N \g_@@_bfliteral_bool

12 \bool_new:N \g_@@_bfupLatin_bool

13 \bool_new:N \g_@@_bfuplatin_bool

14 \bool_new:N \g_@@_bfupGreek_bool

15 \bool_new:N \g_@@_bfupgreek_bool

For sans-style:

16 \bool_new:N \g_@@_upsans_bool

17 \bool_new:N \g_@@_sfliteral_bool

For assorted package options:

18 \bool_new:N \g_@@_upNabla_bool

19 \bool_new:N \g_@@_uppartial_bool

20 \bool_new:N \g_@@_literal_Nabla_bool

21 \bool_new:N \g_@@_literal_partial_bool

22 \bool_new:N \l_@@_smallfrac_bool

23 \bool_new:N \g_@@_literal_colon_bool

24 \bool_new:N \g_@@_mathrm_text_bool

25 \bool_new:N \g_@@_mathit_text_bool

26 \bool_new:N \g_@@_mathbf_text_bool

27 \bool_new:N \g_@@_mathsf_text_bool

28 \bool_new:N \g_@@_mathtt_text_bool

4.2 int

```
29 \int_new:N \g_@@_fam_int  
30 \int_new:N \g_@@_fonts_used_int  
31 \int_new:N \l_@@_primecount_int
```

4.3 tl

```
32 \tl_if_exist:NF \g_@@_secret_hook_tl { \tl_new:N \g_@@_secret_hook_tl }
```

For displaying in warning messages, etc.:

```

9 *Alphabet Unicode positions*

Before we begin, let's define the positions of the various Unicode alphabets so that our code is a little more readable.²

1 (*package)

Alphabets 'Normal':

```
2 \usv_set:nnn {normal} {num}      {48}
3 \usv_set:nnn {normal} {Latin}     {"1D434}
4 \usv_set:nnn {normal} {latin}     {"1D44E}
5 \usv_set:nnn {normal} {Greek}     {"1D6E2}
6 \usv_set:nnn {normal} {greek}     {"1D6FC}
7 \usv_set:nnn {normal} {varTheta}   {"1D6F3}
8 \usv_set:nnn {normal} {epsilon}    {"1D716}
9 \usv_set:nnn {normal} {vartheta}   {"1D717}
10 \usv_set:nnn {normal} {varkappa}  {"1D718}
11 \usv_set:nnn {normal} {phi}       {"1D719}
12 \usv_set:nnn {normal} {varrho}    {"1D71A}
13 \usv_set:nnn {normal} {varpi}    {"1D71B}
14 \usv_set:nnn {normal} {Nabla}    {"1D6FB}
15 \usv_set:nnn {normal} {partial}   {"1D715}
```

Regular weights:

```
16 \usv_set:nnn {up}   {num}      {48}
17 \usv_set:nnn {up}   {Latin}    {65}
18 \usv_set:nnn {up}   {latin}    {97}
19 \usv_set:nnn {up}   {Greek}    {"391}
20 \usv_set:nnn {up}   {greek}    {"3B1}
21 \usv_set:nnn {it}   {Latin}    {"1D434}
22 \usv_set:nnn {it}   {latin}    {"1D44E}
23 \usv_set:nnn {it}   {Greek}    {"1D6E2}
24 \usv_set:nnn {it}   {greek}    {"1D6FC}
25 \usv_set:nnn {bb}   {num}      {"1D7D8}
26 \usv_set:nnn {bb}   {Latin}    {"1D538}
27 \usv_set:nnn {bb}   {latin}    {"1D552}
28 \usv_set:nnn {scr}  {Latin}    {"1D49C}
29 \usv_set:nnn {cal}  {Latin}    {"1D49C}
30 \usv_set:nnn {scr}  {latin}    {"1D4B6}
31 \usv_set:nnn {frak} {Latin}    {"1D504}
32 \usv_set:nnn {frak} {latin}    {"1D51E}
33 \usv_set:nnn {sf}   {num}      {"1D7E2}
34 \usv_set:nnn {sfup} {num}      {"1D7E2}
```

²'U.s.v.' stands for 'Unicode scalar value'.

```

35 \usv_set:nnn {sf} {num} {"1D7E2}
36 \usv_set:nnn {sfup} {Latin} {"1D5A0}
37 \usv_set:nnn {sf} {Latin} {"1D5A0}
38 \usv_set:nnn {sfup} {latin} {"1D5BA}
39 \usv_set:nnn {sf} {latin} {"1D5BA}
40 \usv_set:nnn {sf} {Latin} {"1D608}
41 \usv_set:nnn {sf} {latin} {"1D622}
42 \usv_set:nnn {tt} {num} {"1D7F6}
43 \usv_set:nnn {tt} {Latin} {"1D670}
44 \usv_set:nnn {tt} {latin} {"1D68A}

```

Bold weights:

```

45 \usv_set:nnn {bf} {num} {"1D7CE}
46 \usv_set:nnn {bfup} {num} {"1D7CE}
47 \usv_set:nnn {bf} {num} {"1D7CE}
48 \usv_set:nnn {bfup} {Latin} {"1D400}
49 \usv_set:nnn {bfup} {latin} {"1D41A}
50 \usv_set:nnn {bfup} {Greek} {"1D6A8}
51 \usv_set:nnn {bfup} {greek} {"1D6C2}
52 \usv_set:nnn {bf} {Latin} {"1D468}
53 \usv_set:nnn {bf} {latin} {"1D482}
54 \usv_set:nnn {bf} {Greek} {"1D71C}
55 \usv_set:nnn {bf} {greek} {"1D736}
56 \usv_set:nnn {bfffra} {Latin} {"1D56C}
57 \usv_set:nnn {bfffra} {latin} {"1D586}
58 \usv_set:nnn {bfscr} {Latin} {"1D4D0}
59 \usv_set:nnn {bfcal} {Latin} {"1D4D0}
60 \usv_set:nnn {bfscr} {latin} {"1D4EA}
61 \usv_set:nnn {bfsf} {num} {"1D7EC}
62 \usv_set:nnn {bfsfup} {num} {"1D7EC}
63 \usv_set:nnn {bfsfit} {num} {"1D7EC}
64 \usv_set:nnn {bfsfup} {Latin} {"1D5D4}
65 \usv_set:nnn {bfsfup} {latin} {"1D5EE}
66 \usv_set:nnn {bfsfup} {Greek} {"1D756}
67 \usv_set:nnn {bfsfup} {greek} {"1D770}
68 \usv_set:nnn {bfssfit} {Latin} {"1D63C}
69 \usv_set:nnn {bfssfit} {latin} {"1D656}
70 \usv_set:nnn {bfssfit} {Greek} {"1D790}
71 \usv_set:nnn {bfssfit} {greek} {"1D7AA}

```

The ‘auto’ bolds:

```

72 \usv_set:nnn {bfsf} {Latin} { \bool_if:NTF \g_@@_upLatin_bool \g_@@_bfsfup_Latin_usv \g_@@_bfsfi
73 \usv_set:nnn {bfsf} {latin} { \bool_if:NTF \g_@@_uplatin_bool \g_@@_bfsfup_latin_usv \g_@@_bfsfi
74 \usv_set:nnn {bfsf} {Greek} { \bool_if:NTF \g_@@_upGreek_bool \g_@@_bfsfup_Greek_usv \g_@@_bfsfi
75 \usv_set:nnn {bfsf} {greek} { \bool_if:NTF \g_@@_upgreek_bool \g_@@_bfsfup_greek_usv \g_@@_bfsfi

246 `(/package)`

9.1 STIX fonts

Version 1.0.0 of the STIX fonts contains a number of alphabets in the private use area of Unicode; i.e., it contains many math glyphs that have not (yet or if ever) been accepted into the Unicode standard.

But we still want to be able to use them if possible.

10 Setting up maths chars

1 (*package)

10.1 A token list to contain the data of the math table

Instead of \input-ing the unicode math table every time we want to re-read its data, we save it within a macro. This has two advantages: 1. it should be slightly faster, at the expense of memory; 2. we don't need to worry about catcodes later, since they're frozen at this point.

In time, the case statement inside set_mathsymbol will be moved in here to avoid re-running it every time.

```
2 \group_begin:
3   \file_get:nnN {unicode-math-table.tex} {} \l_@@_mathtable_tl
4   \cs_set:Npn \UnicodeMathSymbol #1#2#3#4
5   {
6     \exp_not:n { \_@@_sym:nnn {#1} {#2} {#3} }
7   }
8   \tl_gset:Nx \g_@@_mathtable_tl {\l_@@_mathtable_tl}
9 \group_end:
```

\@@_input_math_symbol_table: This function simply expands to the token list containing all the data.
10 \@@_cs_new:Nn \@@_input_math_symbol_table: {\g_@@_mathtable_tl}

10.2 Definitions of the active math characters

Ensure catcodes are appropriate; make sure # is an 'other' so that we don't get confused with \mathoctothorpe.

```
11 \AtBeginDocument{\@@_define_math_chars:}
12 \@@_cs_new:Nn \@@_define_math_chars:
13 {
14   \group_begin:
15   \cs_set:Npn \_@@_sym:nnn ##1##2##3
16   {
17     \tl_if_in:nnT
18     { \mathord \mathalpha \mathbin \mathrel \mathpunct \mathop \mathfence }
19     {##3}
20   }
21   \exp_last_unbraced:NNx \cs_gset_eq:NN ##2 { \char_generate:nn {##1} {12} }
22   }
23   }
24 \@@_input_math_symbol_table:
25 \group_end:
26 }
```

10.3 Commands for each symbol/glyph/char

```
\@@_set_mathsymbol:nNn #1 : A LATEX symbol font, e.g., operators
#2 : Symbol macro, e.g., \alpha
#3 : Type, e.g., \mathalpha
#4 : Slot, e.g., "221E
```

There are a bunch of tests to perform to process the various characters. The following assignments should all be fairly straightforward.

The catcode setting is to work around (strange?) behaviour in LuaTeX in which catcode 11 characters don't have italic correction for maths. We don't adjust ascii chars, however, because certain punctuation should not have their catcodes changed.

```
27 \cs_set:Nn \@@_set_mathsymbol:nNn
28 {
29   \bool_lazy_and:nnt

\@@_set_big_operator:n #1 : Symbol font name
#2 : Macro to assign
#3 : Glyph slot

In the examples following, say we're defining for the symbol \sum (Σ). In order for literal Unicode characters to be used in the source and still have the correct limits behaviour, big operators are made math-active. This involves three steps:

- The active math char is defined to expand to the macro \sum_{sym} . (Later, the control sequence \sum will be assigned the math char.)
- Declare the plain old mathchardef for the control sequence \sum_{op} . (This follows the convention of L^AT_EX/amsmath.)
- Define \sum_{sym} as \sum_{op} , followed by nolimits if necessary.

Whether the nolimits suffix is inserted is controlled by the token list $\text{l}_{\text{@}}\text{@}_\text{nolimits_tl}$, which contains a list of such characters. This list is checked dynamically to allow it to be updated mid-document.

Examples of expansion, by default, for two big operators:

```
( \sum → ) ∑ → \sum_{\text{sym}} → \sum_{\text{op}}\text{nolimits}
( \int → ) ∫ → \int_{\text{sym}} → \int_{\text{op}}
```

```

30   }  
31 }
```

11.2 Hooks into L^AT_EX 2_&

Switching to a different style of alphabetic symbols was traditionally performed with commands like \mathbf, which literally changes fonts to access alternate

symbols. This is not as simple with Unicode fonts.

In traditional TeX maths font setups, you simply switch between different ‘families’ (`\fam`), which is analogous to changing from one font to another—a symbol such as ‘a’ will be upright in one font, bold in another, and so on. In `pkgunicode-math`, a different mechanism is used to switch between styles. For every letter (start with ascii a-zA-Z and numbers to keep things simple for now), they are assigned a ‘mathcode’ with `\Umathcode` that maps from input letter to output font glyph slot. This is done with the equivalent of

```
% \Umathcode`\a = 7 1 "1D44E\relax
% \Umathcode`\b = 7 1 "1D44F\relax
% \Umathcode`\c = 7 1 "1D450\relax
% ...
```

When switching from regular letters to, say, `\mathrm`, we now need to execute a new mapping:

```
% \Umathcode`\a = 7 1 '\a\relax
% \Umathcode`\b = 7 1 '\b\relax
% \Umathcode`\c = 7 1 '\c\relax
% ...
```

This is fairly straightforward to perform when we’re defining our own commands such as `\symbf` and so on. However, this means that ‘classical’ TeX font setups will break, because with the original mapping still in place, the engine will be attempting to insert unicode maths glyphs from a standard font.

- `\use@mathgroup` To overcome this, we patch `\use@mathgroup`, which is only used inside of commands such as `\mathXYZ`, so this shouldn’t have any side-effects. Omit the test for math mode because this is only called *inside* `\mathrm` or similar, which already has a math mode check.

```
32 \cs_set:Npn \use@mathgroup #1 #2
33 {
34   \math@bgroup
35   \cs_if_eq:cNF {M@\f@encoding} #1 {#1}
36   \@@_switch_to:n {literal}
37   \@@_mathgroup_set:n {#2}
38   \math@egroup
39 }
```

In LaTeX maths, the command `\operator@font` is defined that switches to the operator mathgroup. The classic example is the `\sin` in `\sin{x}`; essentially we’re using `\mathrm` to typeset the upright symbols, but the syntax is `{\operator@font sin}`. I thought that hooking into `\operator@font` would be hard because all other maths font selection in 2e uses `\mathrm{...}` style. Then reading source2e a little more I stumbled upon `\@fontswitch`. Reimplement that here to avoid `\bgroup/\egroup`.

`\operator@font`

```

40 \cs_set:Npn \operator@font
41 {
42     \@@_switch_to:n {literal}
43     \@@_fontswitch:n { \g_@@_operator_mathfont_tl }
44 }

```

\@@_fontswitch:n Omit the check for math mode as #1 should do that for us.

```

45 \cs_set:Nn \@@_fontswitch:n
46 {
47     \cs_set_eq:NN \math@bgroup \scan_stop:

54         \cs_set_eq:NN \math@egroup \@@@math@egroup
55     }
56     \cs_set_eq:NN \math@egroup \@@_group_end:n
57     #1 \scan_stop:
58 }

```

11.3 Hooks into fontspec

Historically, `\mathrm` and so on were completely overwritten by `unicode-math`, and `fontspec`'s methods for setting these fonts in the classical manner were bypassed.

While we could now re-activate the way that `fontspec` does the following, because we can now change maths fonts whenever it's better to define new commands in `unicode-math` to define the `\mathXYZ` fonts.

11.3.1 Text font

```

59 \cs_generate_variant:Nn \tl_if_eq:nnT {o}
60 \@@_cs_set:Nn \__fontspec_setmainfont_hook:nn
61 {
62     \tl_if_eq:onT {\g__fontspec_mathrm_tl} {\rmdefault}
63     {
64     (XE) \fontspec_gset_family:Nnn \g__fontspec_mathrm_tl {#1} {#2}
65     (LU) \fontspec_gset_family:Nnn \g__fontspec_mathrm_tl {Renderer=Basic,#1} {#2}
66         \__fontspec_setmathrm_hook:nn {#1} {#2}
67     }
68 }
69 \@@_cs_set:Nn \__fontspec_setsansfont_hook:nn
70 {

82             (XE) \fontspec_gset_family:Nnn \g_fontspec_mathtt_tl {\#1} {\#2}
83             (LU) \fontspec_gset_family:Nnn \g_fontspec_mathtt_tl {Renderer=Basic,\#1} {\#2}
84                 \__fontspec_setmathtt_hook:nn {\#1} {\#2}
85         }
86     }

```

11.3.2 Maths font

If the maths fonts are set explicitly, then the text commands above will not execute their branches to set the maths font alphabets.

Helper macro for looking up customisable series' by family (new $\text{\LaTeX} 2\epsilon$ feature 2020).

```

87 \cs_new:Nn \@@_rm_series_default:n
88     {
89         \ifcsname #1series@rm\endcsname
90             \csname #1series@rm\endcsname
91         \else
92             \csname #1default\endcsname
93         \fi
94     }

95 \@@_cs_set:Nn \__fontspec_setmathrm_hook:nn
96     {
97         \SetMathAlphabet\mathrm{normal}\g_fontspec_encoding_tl\g_fontspec_mathrm_tl{\@@_rm_series_de
98         \SetMathAlphabet\mathit{normal}\g_fontspec_encoding_tl\g_fontspec_mathrm_tl{\@@_rm_series_de
99         \SetMathAlphabet\mathbf{normal}\g_fontspec_encoding_tl\g_fontspec_mathrm_tl{\@@_rm_series_de
100    }

101 \@@_cs_set:Nn \__fontspec_setboldmathrm_hook:nn
102    {
103        \SetMathAlphabet\mathrm{bold}\g_fontspec_encoding_tl\g_fontspec_bfmathrm_tl{\@@_rm_series_de
104        \SetMathAlphabet\mathbf{bold}\g_fontspec_encoding_tl\g_fontspec_bfmathrm_tl{\@@_rm_series_de
105        \SetMathAlphabet\mathit{bold}\g_fontspec_encoding_tl\g_fontspec_bfmathrm_tl\mddefault\itdefa
106    }

107 \@@_cs_set:Nn \__fontspec_setmathsf_hook:nn
108    {
109        \SetMathAlphabet\mathsf{normal}\g_fontspec_encoding_tl\g_fontspec_mathsf_tl{\@@_rm_series_de
110        \SetMathAlphabet\mathsf{bold} \g_fontspec_encoding_tl\g_fontspec_mathsf_tl{\@@_rm_series_de
111    }

112 \@@_cs_set:Nn \__fontspec_setmathtt_hook:nn
113    {
114        \SetMathAlphabet\mathtt{normal}\g_fontspec_encoding_tl\g_fontspec_mathtt_tl{\@@_rm_series_de
115        \SetMathAlphabet\mathtt{bold} \g_fontspec_encoding_tl\g_fontspec_mathtt_tl{\@@_rm_series_de
116    }

```

I can't quite remember the logic behind the following two.

If `fontspec` has been loaded and `\setmathsf` (etc) run, this syncs things up:

```
117 \tl_if_eq:onF {\g__fontspec_mathrm_t1} {\rmdefault} { \__fontspec_setmathrm_hook:nn {} {} }  
118 \tl_if_eq:onF {\g__fontspec_mathsf_t1} {\sfdefault} { \__fontspec_setmathsf_hook:nn {} {} }  
119 \tl_if_eq:onF {\g__fontspec_mathtt_t1} {\ttdefault} { \__fontspec_setmathtt_hook:nn {} {} }
```

I suppose this is to make things work if neither `fontspec` or `unicode-math` load any fonts: (I should check that)

```
120 \AtBeginDocument  
121 {  
122   \tl_if_eq:onT {\g__fontspec_mathrm_t1} {\rmdefault} { \__fontspec_setmathrm_hook:nn {} {} }  
123   \tl_if_eq:onT {\g__fontspec_mathsf_t1} {\sfdefault} { \__fontspec_setmathsf_hook:nn {} {} }  
124   \tl_if_eq:onT {\g__fontspec_mathtt_t1} {\ttdefault} { \__fontspec_setmathtt_hook:nn {} {} }  
125 }  
126 
```

12.1 Functions for setting up symbols with mathcodes

\@@_process_symbol_noparse:nnn
\@@_process_symbol_parse:nnn If the range font feature has been used, then only a subset of the Unicode glyphs are to be defined. See section §13.3 for the code that enables this.

```

255 \cs_set:Nn \@@_process_symbol_noparse:nnn
256 {
257     \@@_set_mathsymbol:nNNn {\l_@@_symfont_label_tl} #2 #3 {#1}
258 }
259 \cs_set:Nn \@@_process_symbol_parse:nnn
260 {
261     \@@_if_char_spec:nNT {#1} {#3}
262     {
263         \@@_process_symbol_noparse:nnn {#1} {#2} {#3}
264     }
265 }

```

\@@_remap_symbols: This function is used to define the mathcodes for those chars which should be mapped to a different glyph than themselves.

```

266 \@@_cs_new:Nn \@@_remap_symbols:
267 {
268     \@@_remap_symbol:nnn {'\-' } {\mathbin} {"2212}
269     \@@_remap_symbol:nnn {'\*' } {\mathbin} {"02217}% text asterisk to "centred asterisk"
270     \bool_if:NF \g_@@_literal_colon_bool

```

```

271      {
272          \@@_remap_symbol:n {`\colon} {\mathrel} {"02236}% colon to ratio (i.e., punct to rel)
273      }
274  }

```

\@@_remap_symbol_noparse:nnn Where \@@_remap_symbol:nnn is defined to be one of these two, depending on the range setup:

```

275 \cs_new:Nn \@@_remap_symbol_parse:nnn
276  {
277      \@@_if_char_spec:nNT {#3} {#2}
278      { \@@_remap_symbol_noparse:nnn {#1} {#2} {#3} }
279  }
280 \cs_new:Nn \@@_remap_symbol_noparse:nnn
281  {
282      \clist_map_inline:nn {#1}
283      { \@@_set_mathcode:nnnn {##1} {#2} {\l_@@_symfont_label_tl} {#3} }
284  }

```

12.2 Active math characters

There are more math active chars later in the subscript/superscript section. But they don't need to be able to be typeset directly.

\@@_setup_mathactives: TODO: if not an OpenType math font, we should ignore doing anything with primes. This needs a revamped 'range' feature, I think.

```

285 \@@_cs_new:Nn \@@_setup_mathactives:
286  {
287      \@@_make_mathactive:nNN {"2032} \@@_prime_single_mchar \mathord
288      \@@_make_mathactive:nNN {"2033} \@@_prime_double_mchar \mathord
289      \@@_make_mathactive:nNN {"2034} \@@_prime_triple_mchar \mathord
290      \@@_make_mathactive:nNN {"2057} \@@_prime_quad_mchar \mathord
291      \@@_make_mathactive:nNN {"2035} \@@_backprime_single_mchar \mathord
292      \@@_make_mathactive:nNN {"2036} \@@_backprime_double_mchar \mathord
293      \@@_make_mathactive:nNN {"2037} \@@_backprime_triple_mchar \mathord
294      \@@_make_mathactive:nNN {'\'} \mathstraightquote \mathord
295      \@@_make_mathactive:nNN {'\`} \mathbacktick \mathord
296  }

```

\@@_make_mathactive:nNN Makes #1 a mathactive char, and gives cs #2 the meaning of mathchar #1 with class #3. You are responsible for giving active #1 a particular meaning!

```

297 \cs_new:Nn \@@_make_mathactive_parse:nNN
298  {
299      \@@_if_char_spec:nNT {#1} #3
300      { \@@_make_mathactive_noparse:nNN {#1} #2 #3 }
301  }
302 \cs_new:Nn \@@_make_mathactive_noparse:nNN
303  {

```

```

304     \@@_set_mathchar:NNnn #2 #3 {\l_@@_symfont_label_tl} {#1}
305     \@@_char_gmake_mathactive:n {#1}
306 }

```

12.3 Delimiter codes

\@@_assign_delcode:nn

```

307 \cs_new:Nn \@@_assign_delcode_noparse:nn
308 {
309     \@@_set_delcode:nnn \l_@@_symfont_label_tl {#1} {#2}
310 }
311 \cs_new:Nn \@@_assign_delcode_parse:nn
312 {
313     \@@_if_char_spec:nNT {#2} \@nil
314     {
315         \@@_assign_delcode_noparse:nn {#1} {#2}
316     }
317 }

```

\@@_assign_delcode:n Shorthand.

```
318 \cs_new:Nn \@@_assign_delcode:n { \@@_assign_delcode:nn {#1} {#1} }
```

\@@_setup_delcodes: Some symbols that aren't mathopen/mathclose still need to have delimiter codes assigned. The list of vertical arrows may be incomplete. On the other hand, many fonts won't support them all being stretchy. And some of them are probably not meant to stretch, either. But adding them here doesn't hurt.

```

319 \@@_cs_new:Nn \@@_setup_delcodes:
320 {
321     \@@_assign_delcode:nn {'\'} {\g_@@_slash_delimiter_usv}

353     \@@_assign_delcode:n {"21F3} % updown white arrow
354 }

```

12.4 (Big) operators

The engine does what is necessary to deal with big operators for us automatically with `\Umathchardef`. However, the limits aren't set automatically; that is, we want to define, a la Plain TeX *etc.*, `\def\int{\intop\nolimits}`, so there needs to be a transformation from `\int` to `\intop` during the expansion of `_@@_sym:nnn` in the appropriate contexts.

- `\l_@@_nolimits_tl` This macro is a sequence containing those maths operators that require a `\nolimits` suffix. This list is used when processing `unicode-math-table.tex` to define such commands automatically (see the macro `_@@_set_mathsymbol:nNNn`). I've chosen essentially just the operators that look like integrals; hopefully a better mathematician can help me out here. I've a feeling that it's more useful *not* to include the multiple integrals such as \iiint , but that might be a matter of preference.

```

355 \tl_set:Nn \l_@@_nolimits_tl
356 {
357     \int\iint\iiint\iiiint\oint\oiint\oioint
358     \intclockwise\varointclockwise\ointctr-clockwise\sumint
359     \intbar\intBar\fint\cirfnint\awint\rppointint
360     \scpointint\ncpointint\pointint\sqint\intlarhk\intx
361     \intcap\intcup\upoint\lowint
362 }

```

12.5 Radicals

- `\l_@@_radicals_tl` The radicals are organised in `_@@_set_mathsymbol:nNNn`. We organise radicals in the same way as nolimits-operators. (`\cuberoott` and `\fourthroot`, don't seem to behave as proper radicals.)

```
363 \tl_set:Nn \l_@@_radicals_tl {\sqrt \longdivision \cuberoott \fourthroot}
```

12.6 Fontdimens

364 (*LU)

\@@_mathparam_restore: \glb@settings might not be necessary but is included for symmetry. If the maths font were to be loaded later it would clobber our mathparam settings, so this seems like a sensible move.

```

365 \@@_cs_new:Nn \@@_mathparam_restore:
366 {
367     \glb@settings
368     \tl_use:N \g_@@_mathparam_settings_tl
369 }
```

\@@_mathparam_store: \glb@settings is called to force maths fonts loading *now* so the mathparams are up-to-date.

```

370 \@@_cs_new:Nn \@@_mathparam_store:
371 {

\@@_if_char_spec:nNT #1 : Unicode character slot
#2 : control sequence (math class)
#3 : code to execute

This macro expands to #3 if any of its arguments are contained in \g_@@_char_range_seq. This list can contain either character ranges (for checking with #1) or control sequences. These latter can either be the command name of a specific character, or the math type of one (e.g., \mathbin).

Character ranges are passed to \@@_if_char_spec:nNT, which accepts input in the form shown in table 1.

Table 1: Ranges accepted by \@@_if_char_spec:nNT.

Input	Range
x	$r = x$
x-	$r \geq x$
-y	$r \leq y$
x-y	$x \leq r \leq y$

We have three tests, performed sequentially in order of execution time. Any test finding a match jumps directly to the end.

```

119 \cs_new:Nn \@@_if_char_spec:nNT
120 {
121     % math class:
122     \seq_if_in:NnT \g_@@_mclass_range_seq {#2}

124
125     % character slot:
126     \seq_map_inline:Nn \g_@@_char_range_seq
127     {
128         \@@_int_if_slot_is_last_in_range:nnT {#1} {##1}
129         { \seq_gremove_all:Nn \g_@@_char_range_seq {##1} }
130
131         \@@_int_if_slot_in_range:nnT {#1} {##1}
132         { \seq_map_break:n { \use_none_delimit_by_q_nil:w } }
133     }
134

```

```

135      % the following expands to nil if no match was found:
136      \use:none:nnn
137      \q_nil
138      \use:n
139      {
140          \cs_if_eq:NNT #2 \mathalpha
141          {
142              \clist_put_right:Nx \l_@@_mathmap_charints_clist { \int_eval:n {#1} }
143          }
144          #3
145      }
146  }

```

\@@_int_if_slot_in_range:nNt Pretty basic comma separated range processing. Donald Arseneau's selectcp package has a cleverer technique.

A 'numrange' is like -2,5-8,12,17- (can be unsorted).

Four cases, four argument types:

```

% input      #2      #3      #4
% "1"        [ 1] - [qn] - [   ] qs
% "1-"       [ 1] - [   ] - [qn-] qs
% "-3"       [   ] - [ 3] - [qn-] qs
% "1-3"      [ 1] - [ 3] - [qn-] qs

147 \cs_new:Nn \@@_int_if_slot_in_range:nNt
148  {
149      \@@_numrange_parse:nwT {#1} #2 - \q_nil - \q_stop {#3}
150  }

151 \cs_set:Npn \@@_numrange_parse:nwT #1 #2 - #3 - #4 \q_stop #5
152  {

14 Cross-platform interface for font parameters

1 (*package)

X_ET_EX and LuaT_EX have different interfaces for math font parameters. We use LuaT_EX's interface because it's much better, but rename the primitives to be more L_AT_EX3-like. There are getter and setter commands for each font parameter. The names of the parameters is derived from the LuaT_EX names, with underscores inserted between words. For every parameter \Umath{LuaT_EX name}, we define an expandable getter command \@@_{\LATEX3 name}:N and a protected setter command \@@_set_{\LATEX3 name}:Nn. The getter command takes one of the style primitives (\displaystyle etc.) and expands to the font parameter, which is a *dimension*. The setter command takes a style primitive and a dimension expression, which is parsed with \dim_eval:n.

Often, the mapping between font dimensions and font parameters is bijective, but there are cases which require special attention:

- Some parameters map to different dimensions in display and non-display styles.
- Likewise, one parameter maps to different dimensions in non-cramped and cramped styles.
- There are a few parameters for which X_ET_EX doesn't seem to provide \font-dimens; in this case the getter and setter commands are left undefined.

Cramped style tokens LuaT_EX has \crampeddisplaystyle etc., but they are loaded as \luatexcrampeddisplaystyle etc. by the luatextra package. X_ET_EX, however, doesn't have these primitives, and their syntax cannot really be emulated. Nevertheless, we define these commands as quarks, so they can be used as arguments to the font parameter commands (but nowhere else). Making these commands available is necessary because we need to make a distinction between cramped and non-cramped styles for one font parameter.

\@@_new_cramped_style:N #1 : command

Define *command* as a new cramped style switch. For LuaT_EX, simply rename the corresponding primitive if it is not already defined. For X_ET_EX, define *command* as a new quark.

```
2 \cs_new_protected_nopar:Nn \@@_new_cramped_style:N
3 (XE) { \tl_const:Nn #1 { \use_none:n #1 } }
4 (LU) {
5 (LU)   \cs_if_exist:NF #1
6 (LU)     { \cs_new_eq:Nc #1 { luatex \cs_to_str:N #1 } }
7 (LU) }
```

```

\crampeddisplaystyle
  \crampedtextstyle
  \crampedscripstyle
\crampedscripstyle
  \crampedscripstyle
  \crampedscripstyle

```

Font dimension mapping Font parameters may differ between the styles. \LaTeX accounts for this by having the parameter primitives take a style token argument. To replicate this behavior in \XeTeX , we have to map style tokens to specific combinations of font dimension numbers and math fonts (\textfont etc.).

```

\@@_font_dimen:Nnnnn #1 : style token
#2 : font dimen for display style
#3 : font dimen for cramped display style
#4 : font dimen for non-display styles
#5 : font dimen for cramped non-display styles

```

Map math style to \XeTeX math font dimension. *(style token)* must be one of the style switches (\displaystyle , $\text{\crampeddisplaystyle}$, ...). The other parameters are integer constants referring to font dimension numbers. The macro expands to a dimension which contains the appropriate font dimension.

```

14.1 Historical commands

```

\@@_fontdimen_to_percent:nN #1 : Font dimen number
\@@_fontdimen_pc_to_pt:nN #2 : Font ‘variable’
\fontdimens 10, 11, and 65 aren’t actually dimensions, they’re percentage values given in units of sp. \@@_fontdimen_to_percent:nn takes a font dimension number and outputs the decimal value of the associated parameter. \@@_fontdimen_pc_to_pt:nn returns a dimension correspond to the current font size relative proportion based on that percentage.

146 \cs_set:Nn \@@_fontdimen_to_percent:nN
147 {
148   \fp_eval:n { \dim_to_decimal_in_sp:n { \fontdimen #1 #2 } / 100 }
149 }
150 \cs_new:Nn \@@_fontdimen_pc_to_pt:nN
151 {
152   \fp_eval:n { \dim_to_decimal_in_sp:n { \fontdimen #1 #2 } / 100 * \f@size }
153 }

\@@_mathstyle_scale:NnnN #1 : A math style (\scriptstyle, say)
#2 : Macro that takes a non-delimited length argument (like \kern)
#3 : Length control sequence to be scaled according to the math style
#4 : Math font face to use for the lookups
This macro is used to scale the lengths reported by \fontdimen according to the scale factor for script- and scriptscript-size objects.

154 \cs_new:Nn \@@_mathstyle_scale:NnnN
155 {

15 Defining the math alphabets per style

1 (*package)

\@@_setup_alphabets: This function is called within \setmathfont to configure the mapping between characters inside math styles. Three modes:

IMPLICIT No ranges specified, set up everything

EXPLICIT Some ranges specified, set up what is requested only

INHERIT Of the slots in the ranges specified, compare against slots in each styled alphabet and only set up those needed

The INHERIT mode saves less time than I was hoping for but is still beneficial in simple cases.

```
2  \@@_cs_new:Nn \@@_setup_alphabets:

144          }
145      }
146  }
147 }

```

Each alphabet style needs to be configured. This happens in Section 17.

```

148 \cs_new:Nn \@@_new_alphabet_config:nnn
149 {
150     \prop_if_exist:cF {g_@@_named_range_#1_prop}
151     { \@@_warning:nnn {no-named-range} {#1} {#2} }
152
153
154     \prop_gput:cnn {g_@@_named_range_#1_prop} { alpha_tl }
155     {
156         \prop_item:cn {g_@@_named_range_#1_prop} { alpha_tl } {#2}
157     }
158 % Q: do I need to bother removing duplicates?
159

```

Create list of all chars defined in this named range:

```

160      \cs_new:cn { @_config_#1_#2:n }
161      {
162          \clist_gclear_new:c {g_@@_named_slots_#1_#2_clist}
163          \tl_set:Nn \l_@@_curr_named_slot { g_@@_named_slots_#1_#2_clist }
164          #3
165          \clist_gremove_duplicates:c {g_@@_named_slots_#1_#2_clist}
166      }
167
168  }

169 \cs_new:Nn \@@_alphabet_config:nnn
170 {
171     \use:c { @_config_#1_#2:n } {#3}
172 }

173 \prg_new_if_exist:cTF { @_config_#1_#2:n }
174 {
175     \prg_return_true: \prg_return_false:
176 }
177 }
```

15.1 Mapping ‘naked’ math characters

Before we show the definitions of the alphabet mappings using the functions `\@@_alphabet_config:nnn \l_@@_style_t1 {##1} {...}`, we first want to define some functions to be used inside them to actually perform the character mapping.

15.1.1 Functions

`\@@_map_char_single:nn` Wrapper for `\@@_map_char_noparse:nn` or `\@@_map_char_parse:nn` depending on the context.

```

\@@_map_char_noparse:nn
\@@_map_char_parse:nn 178 \cs_new:Nn \@@_map_char_noparse:nn
179 {
180     \@@_set_mathcode:nnnn {#1} {\mathalpha} {\l_@@_symfont_label_t1} {#2}
181 }

182 \cs_new:Nn \@@_map_char_parse:nn
183 {
184     \@@_if_char_spec:nNT {#1} {\mathalpha}
185     { \@@_map_char_noparse:nn {#1}{#2} }
186 }
```

`\@@_map_char_single:nn` #1 : char name (‘dotlessi’)
#2 : from alphabet(s)
#3 : to alphabet
Logical interface to `\@@_map_char_single:nn`.

```

187 \cs_new:Nn \@@_map_char_single:nnn
```

```

188     {
189         \@@_map_char_single:nn { \@@_to_usv:nn {#1} {#3} }
190                     { \@@_to_usv:nn {#2} {#3} }
191     }

```

\@@_map_chars_range:nnnn #1 : Number of chars (26)
#2 : From style, one or more (it)
#3 : To style (up)
#4 : Alphabet name (Latin)

First the function with numbers:

```

192 \cs_set:Nn \@@_map_chars_range:nnn
193 {
194     \int_step_inline:nnnn {0} {1} {#1-1}
195         { \@@_map_char_single:nn {#2##1} {#3##1} }
196
197     \clist_gput_right:cx { \l_@@_curr_named_slot }
198         { \int_eval:n { #3 } - \int_eval:n { #3 + #1-1 } }
199 }

```

And the wrapper with names:

```

200 \cs_new:Nn \@@_map_chars_range:nnnn
201 {
202     \@@_map_chars_range:nnn {#1} { \@@_to_usv:nn {#2} {#4} }
203                     { \@@_to_usv:nn {#3} {#4} }
204 }

```

15.1.2 Functions for ‘normal’ alphabet symbols

\@@_set_normal_char:nnn

```

205 \cs_set:Nn \@@_set_normal_char:nnn
206 {
207     \@@_usv_if_exist:nnT {#3} {#1}
208     {
209         \clist_map_inline:nn {#2}
210         {
211             \@@_set_mathalphabet_pos:nnnn {normal} {#1} {##1} {#3}
212             \@@_map_char_single:nnn {##1} {#3} {#1}
213
214             \clist_gput_right:cx { \l_@@_curr_named_slot }
215                 { \int_eval:n { \@@_to_usv:nn {#3} {#1} } }
216         }
217     }
218 }
219 \cs_new:Nn \@@_set_normal_Latin:nn
220 {
221     \clist_map_inline:nn {#1}
222     {
223         \@@_set_mathalphabet_Latin:nnn {normal} {##1} {#2}

```

```

224         \@@_map_chars_range:nnnn {26} {##1} {#2} {Latin}
225     }
226 }
227 \cs_new:Nn \@@_set_normal_latin:nn
228 {
229     \clist_map_inline:nn {#1}
230     {
231         \@@_set_mathalphabet_latin:nnn {normal} {##1} {#2}
232         \@@_map_chars_range:nnnn {26} {##1} {#2} {latin}
233     }
234 }
235 \cs_new:Nn \@@_set_normal_greek:nn
236 {
237     \clist_map_inline:nn {#1}
238     {

269 }

```

15.2 Mapping chars inside a math style

15.2.1 Functions for setting up the maths alphabets

```
\@@_set_mathalphabet_char:nnn #1 : Maths alphabet, e.g., 'bb'  
#2 : Input slot, e.g., the slot for 'A' (comma separated)  
#3 : Output slot, e.g., the slot for 'A'  
This is a wrapper for either \@@_mathmap_noparse:nnn or \@@_mathmap_parse:nnn,  
depending on the context.  
  
\@@_mathmap_noparse:nnn #1 : Maths alphabet, e.g., 'bb'  
#2 : Input slot, e.g., the slot for 'A' (comma separated)  
#3 : Output slot, e.g., the slot for 'A'  
Adds \@@_set_mathcode:nnnn declarations to the specified maths alphabet's def-  
inition.  
270 \cs_new:Nn \@@_mathmap_noparse:nnn  
271 {  
272     \tl_gput_right:cx { g_@@_switchto_#1_tl }  
273     {  
274         \@@_set_mathcode:nnnn {#2} {\mathalpha} {\l_@@_symfont_label_tl} {#3}  
275     }  
276 }  
  
\@@_mathmap_parse:nnn #1 : Maths alphabet, e.g., 'bb'  
#2 : Input slot, e.g., the slot for 'A' (comma separated)  
#3 : Output slot, e.g., the slot for 'A'  
When \@@_if_char_spec:nNT is executed, it populates the \l_@@_mathmap_-  
charints_clist macro with slot numbers corresponding to the specified range. This  
range is used to conditionally add \@@_set_mathcode:nnnn declaractions to the  
maths alphabet definition.  
277 \cs_new:Nn \@@_mathmap_parse:nnn  
278 {  
279     \exp_args:NNx \clist_if_in:NnT \l_@@_mathmap_charints_clist { \int_eval:n {#3} }  
280     {  
281         \@@_mathmap_noparse:nnn {#1} {#2} {#3}  
282     }  
283 }  
  
\@@_set_mathalphabet_char:nnnn #1 : math style command  
#2 : input math alphabet name  
#3 : output math alphabet name  
#4 : char name to map  
284 \cs_new:Nn \@@_set_mathalphabet_char:nnnn  
285 {  
286     \@@_set_mathalphabet_char:nnn {#1} { \@@_to_usv:nn {#2} {#4} }  
287             { \@@_to_usv:nn {#3} {#4} }  
288 }
```

```
\@@_set_mathalph_range:nnnn #1 : Number of iterations
#2 : Sym command suffix
#3 : Starting input char
#4 : Starting output char
Loops through character ranges setting \mathcode. First the version that uses
numbers:
```

```
289 \cs_new:Nn \@@_set_mathalph_range:nnnn
290 {
291     \int_step_inline:nnnn {0} {1} {#1-1}
292         { \@@_set_mathalphabet_char:nnn {#2} { ##1 + #3 } { ##1 + #4 } }
293 }
```

```
\@@_set_mathalph_range:nnnn #1 : Number of iterations
#2 : Sym command suffix
#3 : input style
#4 : output style
#5 : alphabet
```

Then the wrapper version that uses names:

```
294 \cs_new:Nn \@@_set_mathalph_range:nnnnn
295 {
296     \clist_gput_right:cx { \l_@@_curr_named_slot }
297         { \int_eval:n { \@@_to_usv:nn {#4} {#5} } - \int_eval:n { (#1-
298             1)+\@@_to_usv:nn {#4} {#5} } }
299     \@@_set_mathalph_range:nnnn {#1} {#2} { \@@_to_usv:nn {#3} {#5} }
300             { \@@_to_usv:nn {#4} {#5} }
301 }
```

15.2.2 Individual mapping functions for different alphabets

```
302 \cs_new:Nn \@@_set_mathalphabet_pos:nnnn
303 {
304     \@@_usv_if_exist:nnT {#4} {#2}
305     {
306         \clist_map_inline:nn {#3}
307             { \@@_set_mathalphabet_char:nnnn {#1} {##1} {#4} {#2} }
308
309         \clist_gput_right:cx { \l_@@_curr_named_slot }
310             { \int_eval:n { \@@_to_usv:nn {#4} {#2} } }
311     }
312 }
```

```
313 \cs_new:Nn \@@_set_mathalphabet_numbers:nnn
314 {
315     \clist_map_inline:nn {#2}
316         { \@@_set_mathalph_range:nnnnn {10} {#1} {##1} {#3} {num} }
317 }
```

```
318 \cs_new:Nn \@@_set_mathalphabet_Latin:nnn
319 {
```

```

320     \clist_map_inline:nn {#2}
321         { \@@_set_mathalph_range:nnnnn {26} {#1} {##1} {#3} {Latin} }
322     }
323 \cs_new:Nn \@@_set_mathalphabet_latin:nn
324 {
325     \clist_map_inline:nn {#2}
326     {
327         \@@_set_mathalph_range:nnnnn {26} {#1} {##1} {#3} {latin}
328         \@@_set_mathalphabet_char:nnnn {#1} {##1} {#3} {h}
329     }
330 }
331 \cs_new:Nn \@@_set_mathalphabet_Greek:nnn
332 {
333     \clist_map_inline:nn {#2}
334     {
335         \@@_set_mathalph_range:nnnnn {25} {#1} {##1} {#3} {Greek}
336         \@@_set_mathalphabet_char:nnnn {#1} {##1} {#3} {varTheta}
337     }
338 }
339 \cs_new:Nn \@@_set_mathalphabet_greek:nnn
340 {
341     \clist_map_inline:nn {#2}
342     {
343         \@@_set_mathalph_range:nnnnn {25} {#1} {##1} {#3} {greek}
344         \@@_set_mathalphabet_char:nnnn {#1} {##1} {#3} {epsilon}
345         \@@_set_mathalphabet_char:nnnn {#1} {##1} {#3} {vartheta}
346         \@@_set_mathalphabet_char:nnnn {#1} {##1} {#3} {varkappa}
347         \@@_set_mathalphabet_char:nnnn {#1} {##1} {#3} {phi}
348         \@@_set_mathalphabet_char:nnnn {#1} {##1} {#3} {varrho}
349         \@@_set_mathalphabet_char:nnnn {#1} {##1} {#3} {varpi}
350     }
351 }
352 
```

16 Mapping in maths alphabets

1 (*package)

16.1 Setting styles

Algorithm for setting alphabet fonts. By default, when range is empty, we are in *implicit* mode. If range contains the name of the math alphabet, we are in *explicit* mode and do things slightly differently.

Implicit mode:

- Try and set all of the alphabet shapes.
- Check for the first glyph of each alphabet to detect if the font supports each alphabet shape.
- For alphabets that do exist, overwrite whatever's already there.
- For alphabets that are not supported, *do nothing*. (This includes leaving the old alphabet definition in place.)

Explicit mode:

- Only set the alphabets specified.
- Check for the first glyph of the alphabet to detect if the font contains the alphabet shape in the Unicode math plane.
- For Unicode math alphabets, overwrite whatever's already there.
- Otherwise, use the ASCII glyph slots instead.

16.2 Defining the math style macros

We call the different shapes that a math alphabet can be a 'math style'. Note that different alphabets can exist within the same math style. E.g., we call 'bold' the math style `bf` and within it there are upper and lower case Greek and Roman alphabets and Arabic numerals.

```
\@@_prepare_mathstyle:n #1 : math style name (e.g., it or bb)
Define the high level math alphabet macros (\mathit, etc.) in terms of unicode-
math definitions. Use \bgroup/\egroup so s'cripts scan the whole thing.

The flag \l_@@_mathstyle_t1 is for other applications to query the current
math style.

\@@_cs_new:Nn \@@_prepare_mathstyle:n
{
```

```

4   \seq_gput_right:Nn \g_@@_mathstyles_seq {#1}
5   \@@_init_alphabet:n {#1}
6   \cs_set_protected:cpx {sym#1}
7   {
8     \@@_group_begin:
9       \exp_not:n
10      {
11        \mode_if_math:F { \exp_args:Nc \non@alpherr {sym#1} }
12        \tl_set:Nn \l_@@_mathstyle_tl {#1}
13      }
14      \@@_switch_to:n {#1}
15      \@@_mathgroup_set:n {-1}
16      \@@_group_end:n
17    }
18  }

```

\@@_init_alphabet:n #1 : math alphabet name (e.g., it or bb)

This macro initialises the macros used to set up a math alphabet. First used when the math alphabet macro is first defined, but then used later when redefining a particular maths alphabet.

```

19 \@@_cs_new:Nn \@@_init_alphabet:n
20 {
21   \@@_log:nx {alph-initialise} {#1}
22   \tl_gclear_new:c {g_@@_switchto_#1_tl}
23   \cs_set_protected:cpx {@@_switchto_#1:} { \tl_use:c {g_@@_switchto_#1_tl} }
24 }
25 \cs_new_protected:Nn \@@_switch_to:n
26 {
27   \tl_use:c {g_@@_switchto_#1_tl}
28 }

```

16.3 Definition of alphabets and styles

The linking between named ranges and symbol style commands happens here. It's currently not using all of the machinery we're in the process of setting up above. Baby steps.

```

29 \@@_cs_new:Nn \@@_default_mathalph:nnn
30 {
31   \prop_new:c {g_@@_named_range_#1_prop}
32   \seq_gput_right:Nn \g_@@_default_mathalph_seq {{#1}{#2}{#3}}
33   \prop_gput:cnn { g_@@_named_range_#1_prop } { default-alpha } {#2}
34 }
35 \@@_default_mathalph:nnn {up} {latin,Latin,greek,Greek,num,misc} {up}
36 \@@_default_mathalph:nnn {it} {latin,Latin,greek,Greek,misc} {it}
37 \@@_default_mathalph:nnn {bb} {latin,Latin,num,misc} {bb}
38 \@@_default_mathalph:nnn {bbit} {misc} {bbit}
39 \@@_default_mathalph:nnn {scr} {latin,Latin} {scr}
40 \@@_default_mathalph:nnn {cal} {Latin} {scr}

```

```

41 \@@_default_mathalph:nnn {bfcal } {Latin}                                {bfscr }
42 \@@_default_mathalph:nnn {frak } {latin,Latin}                            {frak  }
43 \@@_default_mathalph:nnn {tt } {latin,Latin,num}                           {tt   }
44 \@@_default_mathalph:nnn {sfup } {latin,Latin,num}                          {sfup  }
45 \@@_default_mathalph:nnn {sfit } {latin,Latin}                             {sfit  }
46 \@@_default_mathalph:nnn {bfup } {latin,Latin,greek,Greek,num,misc} {bfup }
47 \@@_default_mathalph:nnn {bfit } {latin,Latin,greek,Greek,misc}    {bfit  }
48 \@@_default_mathalph:nnn {bfscr } {latin,Latin}                            {bfscr }
49 \@@_default_mathalph:nnn {bffrak} {latin,Latin}                            {bffrak}
50 \@@_default_mathalph:nnn {bfsfup} {latin,Latin,greek,Greek,num,misc} {bfs-
51                                         fup}
52 \@@_default_mathalph:nnn {bfsfit} {latin,Latin,greek,Greek,misc}      {bfs-
53                                         fit}

```

16.3.1 Define symbol style commands

Finally, all of the ‘symbol styles’ commands are set up, which are the commands to access each of the named alphabet styles. There is not a one-to-one mapping between symbol style commands and named style ranges!

```

52 \clist_map_inline:nn
53 {
54     up, it, bfup, bfit, sfup, sfit, bfsfup, bfsfit, bfsf,
55     tt, bb, bbit, scr, bfscr, cal, bfcal, frak, bffrak,
56     normal, literal, sf, bf,
57 }
58 {
59     \@@_prepare_mathstyle:n #1
60 }

```

16.3.2 New names for legacy textmath alphabet selection

In case a package option overwrites, say, `\mathbf` with `\symbf`.

```

61 \clist_map_inline:nn
62 {
63     rm, it, bf, sf, tt
64     { \cs_set_eq:cc { mathtext #1 } { math #1 } }

```

Perhaps these should actually be defined using a hypothetical unicode-math interface to creating new such styles. To come.

16.3.3 Replacing legacy pure-maths alphabets

The following are alphabets which do not have a math/text ambiguity.

```

64 \clist_map_inline:nn
65 {
66     normal, bb , bbit, scr, bfscr, cal, bfcal, frak, bffrak, tt,
67     bfup, bfit, sfup, sfit, bfsfup, bfsfit, bfsf
68 }
69 {
70     \cs_set:cpx { math #1 } { \exp_not:c { sym #1 } }
71 }

```

16.3.4 New commands for ambiguous alphabets

```
72 \AtBeginDocument { \@@_setup_mathtext: }
73 \@@_cs_new:Nn \@@_setup_mathtext:
74 {
75     \clist_map_inline:nn
76     { rm, it, bf, sf, tt }
77     {
78         \cs_set_protected:cpx { math ##1 }
79         {
80             \exp_not:n { \bool_if:NTF } \exp_not:c { g_@@_math ##1 _text_bool}
81             { \exp_not:c { mathtext ##1 } }
82             { \exp_not:c { sym ##1 } }
83         }
84     }
85 }
```

Alias \mathrm as legacy name for \mathup

```
86 \cs_set_protected:Npn \mathup { \mathrm }
87 \cs_set_protected:Npn \symrm { \symup }
88 
```

18 Primes

[1](#) (*package)

We need a new ‘prime’ algorithm. Unicode math has four pre-drawn prime glyphs.

u+2032 prime (\prime): x'
u+2033 double prime (\dprime): x''
u+2034 triple prime (\trprime): x'''
u+2057 quadruple prime (\qprime): x''''

As you can see, they’re all drawn at the correct height without being superscripted. However, in a correctly behaving OpenType font, we also see different behaviour after the `ssty` feature is applied:

x' x'' x''' x''''

The glyphs are now ‘full size’ so that when placed inside a superscript, their shape will match the originally sized ones. Many thanks to Ross Mills of Tiro Typeworks for originally pointing out this behaviour.

In regular L^AT_EX, primes can be entered with the straight quote character ', and multiple straight quotes chain together to produce multiple primes. Better results can be achieved in `unicode-math` by chaining multiple single primes into a pre-drawn multi-prime glyph; consider x''' vs. x''' .

For Unicode maths, we wish to conserve this behaviour and augment it with the possibility of adding any combination of Unicode prime or any of the n -prime characters. E.g., the user might copy-paste a double prime from another source and then later type another single prime after it; the output should be the triple prime.

Our algorithm is:

- Prime encountered; pcount=1.
- Scan ahead; if prime: pcount:=pcount+1; repeat.
- If not prime, stop scanning.
- If pcount=1, \prime, end.
- If pcount=2, check \dprime; if it exists, use it, end; if not, goto last step.
- Ditto pcount=3 & \trprime.
- Ditto pcount=4 & \qprime.
- If pcount>4 or the glyph doesn’t exist, insert pcount \primes with \primekern between each.

This is a wrapper to insert a superscript; if there is a subsequent trailing superscript, then it is included within the insertion.

Scanning is annoying because I'm too lazy to do it for the general case.

19 *Unicode sub- and super-scripts*

1 (*package)

The idea here is to enter a scanning state after a superscript or subscript is encountered. If subsequent superscripts or subscripts (resp.) are found, they are lumped together. Each sub/super has a corresponding regular size glyph which is used by X_ET_X to typeset the results; this means that the actual subscript/superscript glyphs are never seen in the output document — they are only used as input characters.

Open question: should the superscript-like ‘modifiers’ (u+1D2C modifier capital letter a and on) be included here?

Superscripts Populate a property list with superscript characters; themselves as their key, and their replacement as each key’s value. Then make the superscript active and bind it to the scanning function.

\scantokens makes this process much simpler since we can activate the char and assign its meaning in one step.

```
2 \cs_new:Nn \@@_setup_active_superscript:nn
3 {
4     \prop_gput:Nnx \g_@@_supers_prop { \int_eval:n {#1} } {#2}
5     \@@_mathactive_remap:nn {#1}
6     {
7         \tl_set:Nn \l_@@_ss_chain_tl {#2}
8         \cs_set_eq:NN \@@_sub_or_super:n \sp
9         \tl_set:Nn \l_@@_tmpa_tl {supers}
10        \@@_scan_sscript:
11    }
12 }
```

Subscripts

```
13 \cs_new:Nn \@@_setup_active_subscript:nn
14 {
15     \prop_gput:Nnx \g_@@_subs_prop { \int_eval:n {#1} } {#2}
16     \@@_mathactive_remap:nn {#1}
17     {
18         \tl_set:Nn \l_@@_ss_chain_tl {#2}
19         \cs_set_eq:NN \@@_sub_or_super:n \sb
20         \tl_set:Nn \l_@@_tmpa_tl {subs}
21         \@@_scan_sscript:
22     }
23 }
```

The scanning command Collects a chain of subscripts or a chain of superscripts and then typesets what it has collected.

```

24 \@@_cs_new:Nn \@@_scan_sscript:
25 {
26     \@@_scan_sscript:TF
27     { \@@_scan_sscript: }
28     { \@@_sub_or_super:n {\l_@@_ss_chain_t1} }
29 }
```

We do not skip spaces when scanning ahead, and we explicitly wish to bail out on encountering a space or a brace. These cases are filtered using \peek_N_type:TF. Otherwise the token can be taken as an N-type argument. Then we search for it in the appropriate property list ($\l_@@_tmpa_t1$ is subs or supers). If found, add the value to the current chain of sub/superscripts. Remember to put the character back in the input otherwise. The \group_align_safe_begin: and \group_align_safe_end: are needed in case #3 is &.

```

30 \@@_cs_new:Nn \@@_scan_sscript:TF
31 {
32     \peek_N_type:TF
33     {
34         \group_align_safe_begin:
35         \@@_scan_sscript_aux:nnN {#1} {#2}
36     }
37     {#2}
38 }
```

The look-ahead for the sscripts doesn't try to peek inside the lookahead.

```

39 \@@_cs_new:Nn \@@_scan_sscript_aux:nnN
40 {
41     \tl_set:Nx \l_@@_tmpa_key_t1 { \tl_to_str:n {#3} }
42     \prop_get:cxNTF {g_@@_\l_@@_tmpa_t1 _prop}
43     { \int_eval:n { \exp_after:wN ` \l_@@_tmpa_key_t1 } }
44     \l_@@_tmpb_t1
45     {
46         \tl_put_right:NV \l_@@_ss_chain_t1 \l_@@_tmpb_t1
47         \group_align_safe_end:
48         #1
49     }
50     { \group_align_safe_end: #2 #3 }
51 }
```

um-code-compat.dtx

20 Compatibility

1 (*package)

21 Patching/augmenting 3rd-party packages

21.1 url

Here we need to get `url` in a state such that when it switches to math mode and enters ASCII characters, the maths setup (i.e., `unicode-math`) doesn't remap the symbols into Plane 1. Which is what `\symliteral` is intended to do. This is the same as writing, e.g., `\def\UrlFont{\ttfamily\@_switch_to:n{literal}}` but activates automatically so documents that might change the `\url` font through the standard interface still work correctly.

```
2 \@@_after_package:nNn {url} \@@_patch_url:
3   {
4     \tl_put_left:Nn \Url@FormatString { \@@_switch_to:n {literal} }
5     \tl_put_right:Nn \UrlSpecials
6     {
7       \do ` { \mathchar` ` }
8       \do ' { \mathchar` ' }
9       \do \$ { \mathchar` \$ }
10      \do & { \mathchar` & }
11    }
12  }
```

21.2 mathtools

`mathtools`'s `\cramped` command and others that make use of its internal version use an incorrect font dimension.

The $\text{\textsf{Xe}}\text{\textsf{T}\textit{E}X}$ version is pretty similar to the legacy version, only using the correct font dimensions. Note we used '`\XeTeXradical`' with the family 255 to be almost sure that the radical rule width is not set. Former use of '`\newfam`' had an upsetting effect on legacy math alphabets.

```
13 (*XE)
14 \@@_after_package:nNn { mathtools } \@@_patch_mathtools_A:
15   {
16     \cs_set_nopar:Npn \MT_cramped_internal:Nn ##1 ##2
17     {
18       \hbox_set:Nn \l_tmpa_box
19       {
20         \color@setgroup \c_math_toggle_token \m@th
21         ##1
```

```

22           \dim_zero:N \nulldelimiterspace
23           \XeTeXradical 255 ~ 0 ~ { ##2 }
24           \c_math_toggle_token \color@endgroup
25       }
26   \box_set_ht:Nn \l_tmpa_box
27   {
28     \box_ht:N \l_tmpa_box - \@@_radical_vgap:N ##1
29   }
30   \box_use_drop:N \l_tmpa_box
31 }
32 }
33 (/XE)

```

\overbracket and \underbracket take optional arguments and are defined in terms of rules, so we keep them, and rename ours to \Uoverbracket and \Uunderbracket.

Original definition used the height of \braceld which is not available with Unicode fonts, so we are hard coding the 5/18ex suggested by mathtools's documentation.

```

34 \@@_after_package:nNn { mathtools } \@@_patch_mathtools_B:
35 {
36   \cs_set_eq:NN \MToverbracket \overbracket
37   \cs_set_eq:NN \MTunderbracket \underbracket
38
39 \AtBeginDocument
40 {
41   \msg_warning:nn { unicode-math } { mathtools-overbracket }
42
43 \cs_set:Npn \downbracketfill ##1 ##2
44 {
45   \tl_set:Nn \l_MT_bracketheight_fdim {.27ex}
46   \downbracketend {##1} {##2}
47   \leaders \vrule \@height ##1 \@depth \z@ \hfill
48   \downbracketend {##1} {##2}
49 }
50
51 \cs_set:Npn \upbracketfill ##1 ##2
52 {
53   \tl_set:Nn \l_MT_bracketheight_fdim {.27ex}
54   \upbracketend {##1} {##2}
55   \leaders \vrule \@height \z@ \@depth ##1 \hfill
56   \upbracketend {##1} {##2}
57 }
58
59 \cs_set_eq:NN \Uoverbracket \overbracket
60 \cs_set_eq:NN \Uunderbracket \underbracket
61   \cs_set_eq:NN \overbracket \MToverbracket
62   \cs_set_eq:NN \underbracket \MTunderbracket
63 }

```

```

64      }

\dblcolon mathtools defines several commands as combinations of colons and other charac-
\coloneqq ters, but with meanings incompatible to unicode-math. Thus we issue a warning.
\Coloneqq Note mathtools uses \providecommand \AtBeginDocument.

\eqqcolon 65  \@@_after_package:nNn { mathtools } \@@_patch_mathtools_C:
66  {
67    \msg_warning:nn { unicode-math } { mathtools-colon }
68    \DeclareDocumentCommand \dblcolon {} { \Colon }
69    \DeclareDocumentCommand \coloneqq {} { \coloneq }
70    \DeclareDocumentCommand \Coloneqq {} { \Coloneq }
71    \DeclareDocumentCommand \eqqcolon {} { \eqcolon }
72  }

73  (</package>

```

File XX

um-code-amsmath.dtx

22 Compatibility with amsmath

1 (*package)

Since the mathcode of `‐' is greater than eight bits, this piece of \AtBeginDocument code from amsmath dies if we try and set the maths font in the preamble:

```
2   \tl_remove_once:Nn \begindocumenthook
3   {
4     \mathchardef\std@minus\mathcode`‐\relax
5     \mathchardef\std@equal\mathcode`=\relax
6   }
7   \AtBeginDocument
8   {
9     \Umathcharnumdef\std@minus\Umathcodenum`‐
10    \Umathcharnumdef\std@equal\Umathcodenum`= 
11  }
12  \cs_set:Npn \cdots {\mathinner{\unICODEdots}}
13  \cs_set_eq:NN \dotsb@ \cdots
```

This isn't as clever as the amsmath definition but I think it works:

```
14 (*XE)
15 \def \resetMathstrut@
16 {
17   \setbox\z@\hbox{$($$)}
18   \ht\Mathstrutbox@\ht\z@\dp\Mathstrutbox@\dp\z@
19 }
```

The subarray environment uses inappropriate font dimensions.

```
20 \cs_set:Npn \subarray #1
21 {
22   \vcenter
23   \c_group_begin_token
24   \Let@
25   \restore@math@cr
26   \default@tag
27   \skip_set:Nn \baselineskip
28   {
29     \@@_stack_num_up:N \scriptstyle
30     + \@@_stack_denom_down:N \scriptstyle
31   }
32   \lineskip \@@_stack_vgap:N \scriptstyle
33   \lineskip_limit \lineskip
34   \ialign
35   \c_group_begin_token
36   \token_if_eq_meaning:NNT c #1 { \hfil }
37   \c_math_toggle_token
```

```

38      \m@th
39      \scriptstyle
40      \c_parameter_token \c_parameter_token
41      \c_math_toggle_token
42      \hfil
43      \crcr
44  }
45 (/XE)

```

The roots need a complete rework.

```

23.3 *Synonyms and all the rest*

These are symbols with multiple names. Eventually to be taken care of automatically by the maths characters database.

```

78 \protected\def\to{\rightarrow}
79 \protected\def\le{\leq}
80 \protected\def\ge{\geq}
81 \protected\def\neq{\neq}
82 \protected\def\triangle{\mathord{\bigtriangleup}}
83 \protected\def\bigcirc{\mathord{\text{\rm \texttt{mdlwgwtcircle}}}}
84 \protected\def\circ{\mathord{\text{\rm \texttt{vysmwhtcircle}}}}
85 \protected\def\bullet{\mathord{\text{\rm \texttt{smbblkcircle}}}}
86 \protected\def\mathyen{\text{\rm \texttt{yen}}}
87 \protected\def\mathsterling{\text{\rm \texttt{sterling}}}
88 \protected\def\diamond{\mathord{\text{\rm \texttt{smwhtdiamond}}}}
89 \protected\def\emptyset{\text{\rm \texttt{varnothing}}}
90 \protected\def\hbar{\text{\rm \texttt{hslash}}}
91 \protected\def\land{\text{\rm \texttt{wedge}}}
92 \protected\def\lor{\text{\rm \texttt{vee}}}
93 \protected\def\owns{\text{\rm \texttt{ni}}}
94 \protected\def\gets{\text{\rm \texttt{leftarrow}}}
95 \protected\def\mathring{\text{\rm \texttt{ocirc}}}
96 \protected\def\lnot{\text{\rm \texttt{neg}}}
97 \protected\def\longdivision{\text{\rm \texttt{longdivisionsign}}}

```

These are somewhat odd: (and their usual Unicode uprightness does not match their amssymb glyphs)

```

98 \protected\def\backepsilon{\text{\rm \texttt{upbackepsilon}}}
99 \protected\def\eth{\text{\rm \texttt{matheth}}}

```

These are names that are ‘frozen’ in HTML but have dumb names:

```

100 \protected\def\dbkarow {\dbkarow}
101 \protected\def\drbkarow{\drbkarow}
102 \protected\def\hksearrow{\hksearrow}
103 \protected\def\hkswarrow{\hkswarrow}

```

Due to the magic of OpenType math, big operators are automatically enlarged when necessary. Since there isn't a separate unicode glyph for 'small integral', I'm not sure if there is a better way to do this:

```
104 \protected\def\smallint{\mathop{\textstyle\int}\limits}
```

\underbar

```

105 \cs_set_eq:NN \latexe_underbar:n \underbar
106 \renewcommand\underbar
107 {
108     \mode_if_math:TF \mathunderbar \latexe_underbar:n
109 }

```

\colon Define \colon as a mathpunct ':'. This is wrong: it should be u+003A colon instead! We hope no-one will notice.

```

110 @ifpackageloaded{amsmath}
111 {
112     % define their own colon, perhaps I should just steal it. (It does look much bet-
113     % ter.)
114 }
115 \cs_set_protected:Npn \colon
116 {
117     \bool_if:NTF \g_@@_literal_colon_bool {::} { \mathpunct{:} }
118 }
119 }

```

\digamma I might end up just changing these in the table.

```
\Digamma 120 \protected\def\digamma{\updigamma}
121 \protected\def\Digamma{\upDigamma}
```

Symbols

```

122 \cs_set_protected:Npn \|\ {\Vert}
    \mathinner items:
123 \cs_set_protected:Npn \mathellipsis {\mathinner{\unicodeellipsis}}
124 \cs_set_protected:Npn \cdots {\mathinner{\unicodeddots}}
125 \cs_set_eq:NN \@@_text_slash: \slash
126 \cs_set_protected:Npn \slash
{
    \mode_if_math:TF {\mathslash} {\@@_text_slash:}
129 }

```

23.3.1 \not

The situation of \not symbol is currently messy, in Unicode it is defined as a combining mark so naturally it should be treated as a math accent, however X_ET_EX does not correctly place it as it needs special treatment compared to other accents. Furthermore a math accent changes the spacing of its nucleus, so \not= will be spaced as an ordinary not relational symbol, which is undesired.

Here modify \not to a macro that tries to use predefined negated symbols, which would give better results in most cases, until there is more robust solution in the engines.

This code is based on an answer to a TeX – Stack Exchange question by Enrico Gregorio³.

```
\not
130 \DeclareDocumentCommand \not {m}
131 {
132   \tl_set:Nx \l_@@_not_token_name_tl { \cs_to_str:N #1 }

23.3.2 Full-width remapping

While this could be done with the full mathcode remapping machinery used for the other purposes, it would be fairly redundant with plain ASCII. Worse, this would slow down what is already an inefficient part of `unicode-math`.

Instead we use `mathactive` to do a plain old mapping from full-width to ASCII directly.

Until I get requests for it, I've not included symbols or punctuation here.

Numbers

```

178 \int_step_inline:nnnn {0} {1} {9}
179  {
180    \@@_mathactive_remap:nn {"FF10+#1} {\char\int_eval:n{\`0+#1}}
181  }

```

Letters

```

182 \int_step_inline:nnnn {0} {1} {26}
183  {
184    \@@_mathactive_remap:nn {"FF21+#1} {\char\int_eval:n{\`A+#1}}
185    \@@_mathactive_remap:nn {"FF41+#1} {\char\int_eval:n{\`a+#1}}
186  }

```

23.4 Legacy characters

```
\@@_undeclare_symbol:N
187 \cs_new:Nn \@@_undeclare_symbol:N
188  {
189    \cs_set_protected:Npn #1
```

```
190 { @@_error:nx {legacy-char-not-supported} { \token_to_str:N #1 } }
191 }
```

If you have better ideas about what to do here, please mention.

```
192 @@_undeclare_symbol:N \arrowvert
193 @@_undeclare_symbol:N \Arrowvert
194 @@_undeclare_symbol:N \bracevert
```

24 A secret hook

This will be executed after most if not all of the standard unicode-math setup.

```
195 \AtBeginDocument{\g_@@_secret_hook_t1}
196 </package>
```

Fin

The official end of the package:

```
197 <package>\endinput
```

Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
